

Where Did Typhoon Flooding Fail Relative to NOAA 5-yr Hazard Classes?

Selected major events: distribution of detected flooded cells across NOAA hazard zones

Each bar = one selected typhoon event. Height = fraction of detected flooded 250m cells falling in that NOAA class. R = observed-flood recall = flooded cells in NOAA Medium+High divided by all observed flooded cells within the fixed city buffer. A14G (Sentinel-1, 2014-2024) + PhiISA (2022-2026) union. Events with < 20 detected cells excluded. Full 18-event table is retained in CSV; plot subset chosen by pre-defined event/source/legibility rule. Primary city for each event marked (*) in data. Permanent water not masked here.
