

Where Did Typhoon Flooding Fall Relative to NOAA 5-year Hazard Classes?

Distribution of SAR-detected flooded cells across NOAA hazard zones per event

Each bar = one typhoon event. Height = fraction of SAR-detected flooded 250m cells falling in that NOAA class. The dotted separator marks observed-flood recall: the share above it is inside NOAA Medium+High. AI4G (Sentinel-1, 2014-2024) + PhIISA (2022-2026) union. Events with < 20 detected cells excluded. Primary city for each event marked (*) in data. Permanent water not masked here.
