

NOAH 5-yr Hazard vs Satellite Flood Occurrence Across Major Flood Event Windows
Four-city comparison: Manila, San Fernando, Naga, and Ilagan

Same 250 m city buffers and same selected major flood-event set as the event-distribution figure. Fractions are computed independently over the subset of selected events inside each source period: AI4G (2014–2024) and PhilSA (2022–2026). The combined panel uses the within-event union of the two sources. Only event-city-source cases with ≥ 20 flooded cells are counted. Final panel adds GHSL urbanization context.
