

Manila diagnostic statistics: does PhilSA miss urban flooding?

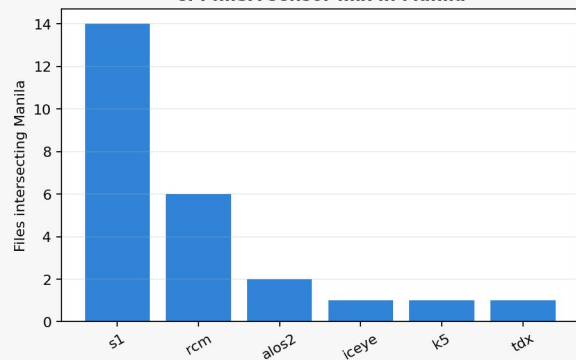

A. Support rises with NOAH class?

B. NOAH-active cells by urban class

C. PhilSA sensor mix in Manila

D. Key numbers

PhilSA rho (NOAH vs count): 0.060
Groundsource rho (NOAH vs score): 0.382

NOAH-active cells: 1,311
any PhilSA hit: 10.8%
any Groundsource hit: 100.0%
supported by both: 0.6%
GS supports, PhilSA misses: 99.3%
weak in both obs sources: 0.1%

Urban NOAH-active cells only:
supported by both: 0.6%
GS supports, PhilSA misses: 99.3%
weak in both obs sources: 0.1%

Interpretation:
Large 'sat gap' with much stronger GS than PhilSA
points to urban satellite detectability limits.
Large 'weak obs' would point more toward drainage,
timing, or NOAH overprediction.
